

LED Drivers for LCD Backlights

Multifunction Backlight LED Driver for Small LCD Panels (Charge Pump Type)

BD6095GUL, BD6095GU

No.11040EAT31

● Description

BD6095GUL/BD6095GU is "Intelligent LED Driver" that is the most suitable for the cellular phone.
It has many functions that are needed to "the upper side" of the cellular phone.
It has ALC function, that is "Low Power Consumption System" realized.
It has "Contents Adaptive Interface" (External PWM control), that is "Low Power Consumption System" realized.
It adopts the very thin CSP package that is the most suitable for the slim phone.

● Features

- 1) Total 5LEDs driver for LCD Backlight
It can set maximum 25.6mA /ch by 128steps (Current DAC) for LCD Display.
3LEDs(LED1~LED3) are same controlled.
Another 2LEDs(LED4~5) can be independent controlled. (Enable and Current setting)
2LEDs(LED4~5) can be attributed to "Main Group".
"Main Group" can be controlled by Auto Luminous Control (ALC) system.
"Main Group" can be controlled by external PWM signal.
- 2) 1LED driver for Flash/Torch
It can set maximum 120mA for Flash LED Driver.
It has Flash mode and Torch mode, there can be changed by external pin or register.
- 3) Auto Luminous Control (ALC)
Main backlight can be controlled by ambient brightness.
Photo Diode, Photo Transistor, Photo IC(Linear/Logarithm) can be connected.
Bias source for ambient light sensor, gain and offset adjustment are built in.
LED driver current as ambient level can be customized.
- 4) 2ch Series Regulator (LDO)
It has selectable output voltage by the register.
LDO1,LDO2 : I_{max}=150mA
- 5) Charge Pump DC/DC for LED driver
It has x1/x1.33/x1.5/x2 mode that will be selected automatically.
Soft start functions
Over voltage protection (Auto-return type)
Over current protection (Auto-return type)
- 6) Thermal shutdown (Auto-return type)
- 7) I²C BUS FS mode (max 400kHz)
- 8) VCSP50L3 (3.75mm², 0.55mm max) Small and thin CSP package (BD6095GUL)
- 9) VCSP85H3 (3.75mm², 1.0mm max) Small and thin CSP package (BD6095GU)

*This chip is not designed to protect itself against radioactive rays.

*This material may be changed on its way to designing.

*This material is not the official specification.

● Absolute Maximum Ratings (Ta=25 °C)

Parameter	Symbol	Ratings	Unit
Maximum voltage	VMAX	7	V
Power Dissipation	Pd	1500	mW
Operating Temperature Range	Topr	-35 ~ +85	°C
Storage Temperature Range	Tstg	-55 ~ +150	°C

(note)Power dissipation deleting is 12.0mW/°C, when it's used in over 25 °C. (It's deleting is on the board that is ROHM's standard)

● Operating conditions (VBAT≥VIO, Ta=-35~85 °C)

Parameter	Symbol	Ratrings		Unit
VBAT input voltage	VBAT	2.7~5.5		V
VIO pin voltage	VIO	1.65~3.3		V

● Electrical Characteristics (Unless otherwise specified, Ta=25°C, VBAT=3.6V, VIO=1.8V)

Parameter	Symbol	Limits			Unit	Condition
		Min.	Typ.	Max.		
【Circuit Current】						
VBAT Circuit current 1	IBAT1	-	0.1	1.0	μA	RESETB=0V, VIO=0V
VBAT Circuit current 2	IBAT2	-	0.5	3.0	μA	RESETB=0V, VIO=1.8V
VBAT Circuit current 3	IBAT3	-	90	150	μA	LDO1=LDO2=ON, I _{LDO} =0mA Other blocks=OFF
VBAT Circuit current 4	IBAT4	-	61	65	mA	DC/DC x1mode, I _{LED} =60mA VBAT=3.7V, LED Vf=3.0V
VBAT Circuit current 5	IBAT5	-	83	94	mA	DC/DC x1.33mode, I _{LED} =60mA VBAT=3.1V, LED Vf=3.0V
VBAT Circuit current 6	IBAT6	-	93	104	mA	DC/DC x1.5mode, I _{LED} =60mA VBAT=2.9V, LED Vf=3.5V
VBAT Circuit current 7	IBAT7	-	124	136	mA	DC/DC x2mode, I _{LED} =60mA VBAT=3.2V, LED Vf=4.0V
VBAT Circuit current 8	IBAT8	-	0.25	1.0	mA	Only ALC block ON ADCYC=0.5s setting Except sensor current
【LED Driver】

16	C6	C2N	I/O	VBAT	GND	Charge Pump capacitor is connected	F
17	B6	C2P	I/O	-	GND	Charge Pump capacitor is connected	G
18	A4	C3N	I/O	VBAT	GND	Charge Pump capacitor is connected	F
19	A5	C3P	I/O	-	GND	Charge Pump capacitor is connected	G
20	B4	VOUT	O	-	GND	Charge Pump output pin	A
21	F2	LDO1O	O	VBAT	GND	LDO1 output pin	Q
22	E2	LDO2O	O	VBAT	GND	LDO2 output pin	Q
23	D2	LED1	I	-	GND	LED cathode connection 1	E
24	C2	LED2	I	-	GND	LED cathode connection 2	E
25	C1	LED3	I	-	GND	LED cathode connection 3	E
26	B1	LED4	I	-	GND	LED cathode connection 4	E
27	B2	LED5	I	-	GND	LED cathode connection 5	E
28	A2	LEDFL	I	-	GND	LED cathode connection for Flash	E
29	F5	SBIAS	O	VBAT	GND	Bias output for the Ambient Light Sensor	Q
30	F3	SSENS	I	VBAT	GND	Ambient Light Sensor input	N
31	E4	GC1	O	VBAT	GND	Ambient Light Sensor gain control output 1	X
32	E3	GC2	O	VBAT	GND	Ambient Light Sensor gain control output 2	X
33	E5	SGND	-	VBAT	-	Ground	B
34	D1	WPWMIN	I	VBAT	GND	External PWM input for Back Light	L
35	D3	FLASHCNT	I	VBAT	GND	External enable for Flash	L

※ The LED terminal that isn't used is to short-circuit to the ground. But, the setup of a register concerned with LED that isn't used is prohibited.

Total: 35 Pin

● Equivalent Circuit

● I²C BUS format

The writing/reading operation is based on the I²C slave standard.

- Slave address

A7	A6	A5	A4	A3	A2	A1	R/W
1	1	1	0	1	1	0	1/0

- Bit Transfer

SCL transfers 1-bit data during H. SCL cannot change signal of SDA during H at the time of bit transfer. If SDA changes while SCL is H, START conditions or STOP conditions will occur and it will be interpreted as a control signal.

- START and STOP condition

When SDA and SCL are H, data is not transferred on the I²C bus. This condition indicates, if SDA changes from H to L while SCL has been H, it will become START (S) conditions, and an access start, if SDA changes from L to H while SCL has been H, it will become STOP (P) conditions and an access end.

- Acknowledge

It transfers data 8 bits each after the occurrence of START condition. A transmitter opens SDA after transfer 8bits data, and a receiver returns the acknowledge signal by setting SDA to L.

- Writing protocol

A register address is transferred by the next 1 byte that transferred the slave address and the write-in command. The 3rd byte writes data in the internal register written in by the 2nd byte, and after 4th byte or, the increment of register address is carried out automatically. However, when a register address turns into the last address, it is set to 00h by the next transmission. After the transmission end, the increment of the address is carried out.

- Reading protocol

It reads from the next byte after writing a slave address and R/W bit. The register to read considers as the following address accessed at the end, and the data of the address that carried out the increment is read after it. If an address turns into the last address, the next byte will read out 00h. After the transmission end, the increment of the address is carried out.

- Multiple reading protocols

After specifying an internal address, it reads by repeated START condition and changing the data transfer direction. The data of the address that carried out the increment is read after it. If an address turns into the last address, the next byte will read out 00h. After the transmission end, the increment of the address is carried out.

As for reading protocol and multiple reading protocols, please do \bar{A} (not acknowledge) after doing the final reading operation. It stops with read when ending by A(acknowledge), and SDA stops in the state of Low when the reading data of that time is 0. However, this state returns usually when SCL is moved, data is read, and A(not acknowledge) is done.

00h	W	-	-	-	-	-	-	-	SFTRST
Initial Value	00h	-	-	-	-	-	-	-	0

Bit [7:1] : (Not used)

Bit0 : **SFTRST** Software Reset Command

“0” : Reset cancel

“1” : Reset (All register initializing)

Refer to “The explanation of Reset” for detail.

Address 01h < LED, ALC Control >

Address	R/W	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
01h	W	-	LED5MD(1)	LED5MD(0)	LED4MD	-	WPWMEN	ALCEN	MLEDMD
Initial Value	00h	-	0	0	0	-	0	0	0

Bit7 : (Not used)

Bit [6:5] : **LED5MD(1:0)** LED5 Group Select (Main/Sub/OFF)

“00” : LED5 OFF

“01” : reserved

“10” : LED5 “Sub Group”

“11” : LED5 “Main Group”

Refer to “The explanation of LED Driver” for detail.

Bit4 : **LED4MD** LED4 Group Select (Main/Sub)

“0” : LED4 “Sub Group”

“1” : LED4 “Main Group”

Refer to “The explanation of LED Driver” for detail.

Bit3 : (Not used)

Bit2 : **WPWMEN** External PWM Input “WPWMIN” terminal Enable Control (Valid/Invalid)

“0” : WPWMIN input invalid

“1” : WPWMIN input valid

Refer to “(11) Current Adjustment” of “The explanation of ALC” for detail.

Bit1 : **ALCEN** ALC Function Control (ON/OFF)

“0” : ALC function OFF

“1” : ALC function ON

Refer to “(1) Auto Luminous Control ON/OFF” of “The explanation of ALC” for detail.

Bit0 : **MLEDMD** “Main Group” LED Mode Select (Non ALC / with ALC)

“0” : Non ALC mode

“1” : ALC mode

Refer to “(1) Auto Luminous Control ON/OFF” of “The explanation of ALC” for detail.

Address 02h < Power Control >

Address	R/W	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
02h	W	FLASHEN	TORCHEN	SLEDEN	MLEDEN	-	-	LDO2EN	LDO1EN
Initial Value	00h	0	0	0	0	-	-	0	0

Bit [7:6] : **FLASHEN, TORCHEN** LEDFL Control (Flash ON / Torch ON / OFF)

(At FLASHCNT=L) (At FLASHCNT=H) "FLASHCNT" means external pin.

- "00" : LEDFL: OFF, Flash mode ON
- "01" : LEDFL: Torch mode ON, Flash mode ON
- "10" : LEDFL: Flash mode ON, Flash mode ON
- "11" : reserved

For Torch/Flash, refer to "Flash LED Current Setting" (address 05h, 06h)

At FLASHCNT=H, even if RESETB=L, the Flash mode becomes ON, and LED is turned on.

But, the setup of LED current becomes the minimum setting in this case.

(Because the setting of LED current is reset at the time of RESETB=L.)

Refer to "The explanation of LED Driver" for detail.

Bit5 : **SLEDEN** Sub Group LED Control (ON/OFF)

- "0" : "Sub Group" LED OFF
- "1" : "Sub Group" LED ON

Bit4 : **MLEDEN** Main Group LED Control (ON/OFF)

- "0" : "Main Group" LED OFF
- "1" : "Main Group" LED ON

Bit [3:2] : (Not used)

Bit1 : **LDO2EN** LDO2 Control (ON/OFF)

- "0" : LDO2 OFF
- "1" : LDO2 ON

Bit0 : **LDO1EN** LDO1 Control (ON/OFF)

- "0" : LDO1 OFF
- "1" : LDO1 ON

●Explanation for operate

1. The explanation of Reset

There are two kinds of reset, software reset and hardware reset.

•Software reset

- All the registers are initialized by SFTRST="1".
- SFTRST is automatically returned to "0". (Auto Return 0).

•Hardware reset

- It shifts to hardware reset by changing RESETB pin "H" → "L".
- The condition of all the registers under hardware reset pin is returned to the initial value, and it stops accepting all address.
- It's possible to release from a state of hardware reset by changing RESETB pin "L" → "H".
- RESETB pin has delay circuit. It doesn't recognize as hardware reset in "L" period under 5μs.
- Even if RESETB=L, at FLASHCNT=H, Flash mode becomes ON by minimum setting.

•Reset Sequence

- When hardware reset was done during software reset, software reset is canceled when hardware reset is canceled.
(Because the initial value of software reset is "0")

2. The explanation of Thermal shutdown

The blocks which thermal shutdown function is effective in the following.

Charge pump
LED Driver
LDO1, LDO2, SBIAS

A thermal shutdown function works in about 190°C.

Detection temperature has a hysteresis, and detection release temperature is about 170 °C.(Design reference value)

3. The explanation of Charge Pump for LED driver

Charge Pump block is designed for the power supply for LED driver.

It has the x1.0/x1.33/x1.5/x2.0 mode. It changes to the most suitable mode automatically by Vf of LED and the battery voltage. It has the mode of x1.33 and it can be higher efficiency than traditional.

•Start

Charge Pump circuit operates when any LED turns ON.

•Soft start

When the start of the Charge Pump circuit is done, it has the soft start function to prevent a rush current.

(*1) An EN signal in the upper figure means the following:

"EN is high" = Any LED turns ON

But if Ta > TSD, EN Signal doesn't become effective.

•Charge Pump Mode transition

The transition of boost multiple transits automatically by Vf of LED and the battery voltage.

BD6095GUL/BD6095GU changes the four charge pump movement mode automatically to realize low consumption power.

< Mode Up >

A LED terminal voltage is monitored, and the movement mode is changed to $\times 1 \rightarrow \times 1.33$, $\times 1.33 \rightarrow \times 1.5$ and $\times 1.5 \rightarrow \times 2$ automatically when a LED terminal voltage is lower than 0.2V (typ).

At this time, the maximum output voltage of the charge pump is restricted to 5.1V (typ).

< Mode Down >

The rise in the battery voltage, the off control of LED lighting, "Main Group" LED current value and the data writing to the address 04h,05h,06h (LED Current Setting) is monitored, and the movement mode is changed to $\times 2 \rightarrow \times 1.5 \rightarrow \times 1.33 \rightarrow \times 1$ automatically.

This mode down movement lasts until a mode up movement happens.

At Flash mode and Torch mode, the mode down doesn't happen.

The thresholds of rise in a battery voltage are 2.9V, 3.3V, 3.7V and 4.1V (typ).

And, as for the off control of LED lighting, it is shown that MLEDEN, SLEDEN, TORCHEN, FLASHEN and FLASHCNT transited in "1" → "0".

- Over Voltage protection / Over Current protection

Charge Pump circuit output (VOUT) is equipped with the over-voltage protection and the over current protection function. A VOUT over-voltage detection voltage is about 5.5V(typ). (VOUT at the time of rise in a voltage)

A detection voltage has a hysteresis, and a detection release voltage is about 5.1V(typ).

And, when VOUT output short to ground, input current of the battery terminal is limited by an over current protection function.

4. The explanation of LED Driver

•LED1~LED3

LED1~LED3 are same controlled. These are using for “Main backlight” and we call it “Main Group”.

Current setting: IMLED(6:0)

ON/OFF: MLEDEN (ON=1, OFF=0)

•LED4~LED5

LED4 and LED5 can be independent controlled. There are attributed to “Main Group” or “Sub Group”.

If these are attributed to “Main Group”, these are controlled by same as LED1~LED3.

<Independent Control>

Current setting: ISLED(6:0)

ON/OFF: SLEDEN (ON=1, OFF=0)

<Attribute to “Main Group”>

Current setting: IMLED(6:0)

ON/OFF: MLEDEN (ON=1, OFF=0)

•The number of LED Lighting (LED1~LED5)

The number of lighting for Main/Sub LED can be set up grouping by the register

The setting of the number of lighting is as the following.

The Main/Sub LED is independently controlled by register MLEDEN, SLEDEN.

LED5MD(1)	LED5MD(0)	LED4MD	LED1	LED2	LED3	LED4	LED5	Main/Sub Setting Example
0	0	0	Main	Main	Main	Sub	OFF	3 / 0 , 3 / 1
0	0	1	Main	Main	Main	Main	OFF	4 / 0
1	0	0	Main	Main	Main	Sub	Sub	3 / 0 , 3 / 2
1	0	1	Main	Main	Main	Main	Sub	4 / 0 , 4 / 1
1	1	0	Main	Main	Main	Sub	Main	4 / 0 , 4 / 1
1	1	1	Main	Main	Main	Main	Main	5 / 0

The change of the Grouping setting with turning it on is prohibited.

The LED terminal that isn't used must be connected to the ground.

•LEDFL

LEDFL is for Flash. It has the two mode, “Torch” and “Flash”.

Torch mode current: IFTLED(4:0)

Flash mode current: IFFLED(4:0)

ON/OFF: TORCHEN, FLASHEN, FLASHCNT (refer to “Power Control” address 02h)

Flash mode is started by the rise edge of FLASHEN or FLASHCNT.

At FLASHCNT=H, even if RESETB=L, the Flash mode becomes ON, and LED is turned on.

(But, the setup of LED current becomes the minimum setting in this case because current setting is reset.)

Please set FLASHCNT=L when you don't turn on Flash.

5. The explanation of ALC (Auto Luminous Control)

- LCD backlight current adjustment is possible in the basis of the data detected by external ambient light sensor.
- Extensive selection of the ambient light sensors (Photo Diode, Photo Transistor, Photo IC(linear/logarithm)) is possible by building adjustment feature of Sensor bias, gain adjustment and offset adjustment.
- Ambient data is changed into ambient level by digital data processing, and it can be read through I²C I/F.
- Register setting can customize a conversion to LED current. (Initial value is pre-set.)
- Natural dimming of LED driver is possible with the adjustment of the current transition speed.

* Wave form in this explanation just shows operation image, not shows absolute value precisely.

(1) Auto Luminous Control ON/OFF

- ALC block can be independent setting ON/OFF.
 - It can use only to measure the Ambient level.
- Register : ALCEN
Register : MLEDEN
Register : MLEDMD
- Refer to under about the associate ALC mode and Main LED current.

ALCEN	MLEDEN	MLEDMD	Sensor I/F	LED control	Mode	Main LED current
0	0	x	OFF (AMB(3:0)=0h)	OFF	OFF	-
0	1	0		ON	Non ALC mode	IMLED(6:0)
0	1	1				IU0(6:0) (*1)
1	0	x	ON	OFF	-	
1	1	0		ON		IMLED(6:0)
1	1	1			ALC mode (*2)	

(*1) At this mode, because Sensor I/F is OFF, AMB(3:0)=0h.

So, Main LED current is selected Iu0(6:0).

(*2) At this mode, Main LED current is selected Iu0(6:0)~Iuf(6:0)

It becomes current value corresponding to each brightness.

(2) I/V conversion

- The bias voltage and external resistance for the I-V conversion (R_s) are adjusted with adaptation of sensor characteristic
- The bias voltage is selectable by register setup.

Register : VSB

- “0” : SBIAS output voltage 3.0V
“1” : SBIAS output voltage 2.6V

Rs : Sense resistance (A sensor output current is changed into the voltage value.)

SBIAS : Bias power supply terminal for the sensor (3.0V / 2.6V by register setting)

SSENS : Sense voltage input terminal

$$\text{SSENS Voltage} = \text{Iout} \times \text{Rs}$$

(3) Gain control

- Sensor gain switching function is built in to extend the dynamic range.
- It is controlled by register setup.
- When automatic gain control is off, the gain status can be set up in the manual.
- Register : GAIN(1:0)
- GC1 and GC2 are outputted corresponding to each gain status.

	Example 1 (Use BH1600FVC)			Example 2			Example 3		
Application example	 The circuit diagram shows a BH1600 chip connected to VCC, IOUT, GND, and SBIAS. The SSENS pin is connected to a resistor and then to the IOUT pin. The IOUT pin is also connected to GC1 and GC2. The GC1 and GC2 outputs are connected to a logic inverter, which then connects to SGND. A diode is connected between the SBIAS and the junction of the resistor and IOUT.			 The circuit diagram shows a BH1600 chip connected to VCC, IOUT, GND, and SBIAS. The SSENS pin is connected to a resistor and then to the IOUT pin. The IOUT pin is also connected to GC1 and GC2. The GC1 and GC2 outputs are connected to a logic inverter, which then connects to SGND. A diode is connected between the SBIAS and the junction of the resistor and IOUT. Additionally, there is a 9.5 kΩ resistor connected between the SBIAS and the junction of the resistor and IOUT.			 The circuit diagram shows a BH1600 chip connected to VCC, IOUT, GND, and SBIAS. The SSENS pin is connected to a resistor and then to the IOUT pin. The IOUT pin is also connected to GC1 and GC2. The GC1 and GC2 outputs are connected to a logic inverter, which then connects to SGND. A diode is connected between the SBIAS and the junction of the resistor and IOUT.		
	Resister values are relative								
Operating mode	Auto	Manual		Auto	Manual		Fixed		
GAIN(1:0) setting	00	01	High	10	00	01	10		
Gain status	High	Low	High	Low	High	Low	High	Low	-
GC1 output									
GC2 output									

: This means that it becomes High with A/D measurement cycle synchronously.

(*1) : Set up the relative ratio of the resistance in the difference in the brightness change of the High Gain mode and the Low Gain mode carefully.

(4) A/D conversion

- The detection of ambient data is done periodically for the low power.
- SBIAS and ADC are turned off except for the ambient measurement.
- The sensor current may be shut in this function, it can possible to decrease the current consumption.
- SBIAS pin and SSENS pin are pull-down in internal when there are OFF.
- SBIAS circuit has the two modes. (Usually ON mode or intermittent mode)

Register : ADCYC(1:0)

Register : SBIASON

(5) ADC data Gain / offset adjustment

- To correct the characteristic dispersion of the sensor, Gain and offset adjustment to ADC output data is possible.
- They are controlled by register setup.

Register : SGAIN(3:0)

Register : SOFS(3:0)

< Gain Adjustment >

< Offset Adjustment >

(6) Average filter

- Average filter is built in to rid noise or flicker.
- Average is 16 times

(7) Ambient level detection

- Averaged A/D value is converted to Ambient level corresponding to Gain control and sensor type.
- Ambient level is judged to rank of 16 steps by ambient data.
- The type of ambient light sensor can be chosen by register.
(Linear type sensor / Logarithm type sensor)

Register : STYPE

“0” : For Linear sensor

“1” : For Log sensor

- Ambient level is output through I²C.

Register : AMB(3:0)

STYPE	0					1
GAIN(1:0)	00		10	01	11	xx
Gain Status	Low	High	Low	High	-	-
Ambient level	SSENS voltage

- This is in case of not adjustments of the gain/offset control.
- In the Auto Gain control mode, sensor gain changes in gray-colored ambient level.
- “/” : This means that this zone is not outputted in this mode.

(8) LED current assignment

- LED current can be assigned as each of 16 steps of the ambient level.
 - Setting of a user can do by overwriting, though it prepares for the table setup in advance.
- Register : IU*(6:0)

Conversion Table (initial value)

Ambient Level	Setting data	Current value	Ambient Level	Setting data	Current value
0h	11h	3.6mA	8h	48h	14.6mA
1h	13h	4.0mA	9h	56h	17.4mA
2h	15h	4.4mA	Ah	5Fh	19.2mA
3h	18h	5.0mA	Bh	63h	20.0mA
4h	1Eh	6.2mA	Ch	63h	20.0mA
5h	25h	7.6mA	Dh	63h	20.0mA
6h	2Fh	9.6mA	Eh	63h	20.0mA
7h	3Bh	12.0mA	Fh	63h	20.0mA

(9) Slope process

- Slope process is given to LED current to dim naturally.
 - LED current changes in the 256Step gradation in sloping.
 - Up(dark→bright),Down(bright→dark) LED current transition speed are set individually.
- Register : THL(3:0)
- Register : TLH(3:0)
- Main LED current changes as follows at the time as the slope. THL (TLH) is setup of time of the current step 2/256.

(10) LED current reset when mode change

- When mode is changed (ALC \leftrightarrow Non ALC), it can select the way to sloping.
- Register : MDCIR
- "0" : LED current non-reset when mode change
 - "1" : LED current reset when mode change

(11) Current adjustment

- When it is permitted by the register setting, PWM drive by the external terminal (WPWMIN) is possible.
- Register : WPWMEN
- It is suitable for the intensity correction by external control, because PWM based on Main LED current of register setup or ALC control.

WPWMEN	WPWMIN (External input)	Back light current	
0	L	ON	PWM input invalid
0	H	ON	
1	L	Forced OFF	PWM input valid
1	H	ON	

Current ON is depending on "MLEDEN".

It can be inputted WPWMIN before MLEDEN=1.
It can be set WPWMEN=1 before MLEDEN=1.
PWM movement is effective at the time LED current rise up.

PWM High pulse width must be more than 80μs.

6. The explanation of I/O

When the RESETB pin is Low, the input buffers (SDA and SCL) are disabling for the Low consumption power.

7. The explanation of the start of LDO1~LDO2

It must start as follows.

<Start Sequence>

VBAT ON (Enough rise up) → VIO ON (Enough rise up) → Reset release → LDO ON
(Register access acceptable)

<End Sequence>

LDO OFF → Reset → VIO OFF (Enough fall down) → VBAT OFF

8. The explanation of the terminal management of the function that isn't used

Set up the terminal that isn't used as follows.

The LED terminal which isn't used : Short to ground

Don't do the control concerned with this terminal.

T1, T2 : Short to ground

T3, T4 : Open

7th layer

8th layer(solder)

●Notes for use**(1) Absolute Maximum Ratings**

An excess in the absolute maximum ratings, such as supply voltage, temperature range of operating conditions, etc., can break down devices, thus making impossible to identify breaking mode such as a short circuit or an open circuit. If any special mode exceeding the absolute maximum ratings is assumed, consideration should be given to take physical safety measures including the use of fuses, etc.

(2) Power supply and ground line

Design PCB pattern to provide low impedance for the wiring between the power supply and the ground lines. Pay attention to the interference by common impedance of layout pattern when there are plural power supplies and ground lines. Especially, when there are ground pattern for small signal and ground pattern for large current included the external circuits, please separate each ground pattern. Furthermore, for all power supply pins to ICs, mount a capacitor between the power supply and the ground pin. At the same time, in order to use a capacitor, thoroughly check to be sure the characteristics of the capacitor to be used present no problem including the occurrence of capacity dropout at a low temperature, thus determining the constant.

(3) Ground voltage

Make setting of the potential of the ground pin so that it will be maintained at the minimum in any operating state. Furthermore, check to be sure no pins are at a potential lower than the ground voltage including an actual electric transient.

(4) Short circuit between pins and erroneous mounting

In order to mount ICs on a set PCB, pay thorough attention to the direction and offset of the ICs. Erroneous mounting can break down the ICs. Furthermore, if a short circuit occurs due to foreign matters entering between pins or between the pin and the power supply or the ground pin, the ICs can break down.

(5) Operation in strong electromagnetic field

Be noted that using ICs in the strong electromagnetic field can malfunction them.

(6) Input pins

In terms of the construction of IC, parasitic elements are inevitably formed in relation to potential. The operation of the parasitic element can cause interference with circuit operation, thus resulting in a malfunction and then breakdown of the input pin. Therefore, pay thorough attention not to handle the input pins, such as to apply to the input pins a voltage lower than the ground respectively, so that any parasitic element will operate. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. In addition, even if the power supply voltage is applied, apply to the input pins a voltage lower than the power supply voltage or within the guaranteed value of electrical characteristics.

(7) External capacitor

In order to use a ceramic capacitor as the external capacitor, determine the constant with consideration given to a degradation in the nominal capacitance due to DC bias and changes in the capacitance due to temperature, etc.

(8) Thermal shutdown circuit (TSD)

This LSI builds in a thermal shutdown (TSD) circuit. When junction temperatures become detection temperature or higher, the thermal shutdown circuit operates and turns a switch OFF. The thermal shutdown circuit, which is aimed at isolating the LSI from thermal runaway as much as possible, is not aimed at the protection or guarantee of the LSI. Therefore, do not continuously use the LSI with this circuit operating or use the LSI assuming its operation.

(9) Thermal design

Perform thermal design in which there are adequate margins by taking into account the permissible dissipation (Pd) in actual states of use.

(10) LDO

Use each output of LDO by the independence. Don't use under the condition that each output is short-circuited because it has the possibility that an operation becomes unstable.

(11) About the pin for the test, the un-use pin

Prevent a problem from being in the pin for the test and the un-use pin under the state of actual use. Please refer to a function manual and an application notebook. And, as for the pin that doesn't specially have an explanation, ask our company person in charge.

(12) About the rush current

For ICs with more than one power supply, it is possible that rush current may flow instantaneously due to the internal powering sequence and delays. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of wiring.

(13) About the function description or application note or more.

The function description and the application notebook are the design materials to design a set. So, the contents of the materials aren't always guaranteed. Please design application by having fully examination and evaluation include the external elements.

Notes

No copying or reproduction of this document, in part or in whole, is permitted without the consent of ROHM Co.,Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Thank you for your accessing to ROHM product informations.
